sentometrics-package An Integrated Framework for Textual Sentiment Time Series Aggregation and Prediction

Description

The **sentometrics** package is designed to do time series analysis based on textual sentiment. It accounts for the intrinsic challenge that, for a given text, sentiment can be computed in many ways, as well as the large number of possibilities to pool sentiment across text and time. This additional layer of manipulation does not exist in standard time series analysis and text mining packages. The package also provides an automated means to econometrically model the impact of sentiment in texts on

sentometrics-package 3

a given variable, by first computing a wide range of textual sentiment time series and then selecting those that are most informative. Altogether, **sentometrics** integrates the *qualification* of sentiment from texts, the *aggregation* into different sentiment measures and the optimized *prediction* based on these measures.

Main functions

- Feature generation: add_features
- Sentiment computation and aggregation into sentiment measures: sento_corpus, ctr_agg, compute_sentiment, sento_measures, merge_measures, to_global
- Sparse modelling: ctr_model, sento_model
- Prediction and post-modelling analysis: predict.sentomodel, retrieve_attributions, plot_attributions, perform_MCS

Update

The development version of the package resides at https://github.com/sborms/sentometrics.

Note

The methodology behind the sentiment aggregation framework can be consulted in the working paper "Questioning the news about economic growth: Sparse forecasting using thousands of news-based sentiment values" (Ardia, Bluteau, and Boudt, 2017) at https://ssrn.com/abstract=2976084. The vignette "The R package sentometrics to compute, aggregate and predict with textual sentiment" (Ardia, Bluteau, Borms and Boudt, 2017) at https://ssrn.com/abstract=3067734 provides a hands-on introduction to the methodology and the package's functionalities.

Please cite the package in publications. Use citation("sentometrics").

4 add_features

add_features Add feature columns to a sentocorpus

Description

Adds new feature columns, either user-supplied or based on keyword(s)/regex pattern search, to a provided sentocorpus object.

Usage

```
add_features(sentocorpus, featuresdf = NULL, keywords = NULL,
do.binary = TRUE, do.regex = FALSE)
```

Arguments

sentocorpus a sentocorpus object created with sento_corpus.

featuresdf a named data. frame of type numeric where each columns is a new feature to be

added to the inputted sentocorpus object. If the number of rows in featuresdf is not equal to the number of documents in sentocorpus, recycling will occur.

The numeric values should be between 0 and 1 (included).

keywords a named list. For every element, a new feature column is added with a value

of 1 for the texts in which (at least one of) the keyword(s) appear(s), and 0 if not (if do.binary = TRUE), or with as value the normalized number of times the keyword(s) occur(s) in the text (if do.binary = FALSE). If no texts match a keyword, no column is added. The list names are used as the names of the new features. For more complex searching, instead of keywords, one can also directly use a single regex expression to define a new feature (cf. the details

section).

do.binary a logical, cf. argument keywords. If do.binary = FALSE, the counts are

normalized between 0 and 1,

do.regex a logical vector equal in length to the number of elements in the keywords

argument list, or a single value if it applies to all. It should be set to TRUE at those positions where a single regex expression is used to identify the particular

feature.

Details

If a provided feature name is already part of the corpus, it will be replaced. The featuresdf and keywords arguments can be provided at the same time, or only one of them, leaving the other at NULL. The do.regex argument points to the corresponding elements in keywords. For FALSE, we transform the keywords into a simple regex expression, involving "\b" for exact word boundary matching and (if multiple keywords) | as OR operator. The elements associated to TRUE do not undergo the transformation, and are evaluated as given, if the corresponding keywords vector consists of only one expression.

almons 5

Value

An updated sentocorpus object.

Author(s)

Samuel Borms

Examples

```
data("usnews")
# construct a corpus and add a random feature to it
corpus <- sento_corpus(corpusdf = usnews)</pre>
corpus1 <- add_features(corpus,</pre>
                         featuresdf = data.frame(random = runif(quanteda::ndoc(corpus))))
corpus2 <- add_features(corpus,</pre>
                         keywords = list(pres = "president", war = "war"))
corpus3 <- add_features(corpus,</pre>
                         keywords = list(pres = c("Obama", "US president")),
                         do.binary = FALSE)
corpus4 <- add_features(corpus,</pre>
                         featuresdf = data.frame(all = 1),
                         keywords = list(pres1 = c("Obama|US [p|P]resident"),
                                          pres2 = c("\\b0bama\\b|\\bUS president\\b"),
                                          war = c("war")),
                         do.regex = c(TRUE, TRUE, FALSE))
sum(corpus3$documents$pres) == sum(corpus4$documents$pres2) # TRUE
```

almons

Compute Almon polynomials

Description

Computes Almon polynomial weighting curves. Handy to self-select specific time aggregation weighting schemes for input in ctr_agg.

Usage

```
almons(n, orders = 1:3, do.inverse = TRUE, do.normalize = TRUE)
```

Arguments

n	a single numeric to indicate the length of the curve (the number of lags, cf., n).
orders	a numeric vector as the sequence of the Almon orders (cf., b). The maximum value corresponds to B .
do.inverse	TRUE if the inverse Almon polynomials should be calculated as well.
do.normalize	TRUE if polynomials should be normalized to unity.

6 compute_sentiment

Details

The Almon polynomial formula implemented is: $(1 - (i/n)^b)(i/n)^{B-b}$, where i is the lag index from 1 to n.

Value

A data.frame of all Almon polynomial weighting curves, of size length(orders) (times two if do.inverse = TRUE).

See Also

ctr_agg

compute_sentiment

Compute document-level sentiment across features and lexicons

Description

Given a corpus of texts, computes sentiment per document using the bag-of-words approach based on the lexicons provided and a choice of aggregation across words per document. Relies partly on the **quanteda** package. The scores computed are net sentiment (sum of positive minus sum of negative scores).

Usage

```
compute_sentiment(sentocorpus, lexicons, how = get_hows()$words, dfm = NULL)
```

Arguments

sentocorpus a sentocorpus object created with sento_corpus.

lexicons output from a setup_lexicons call.

how a single character vector defining how aggregation within documents should

be performed. For currently available options on how aggregation can occur, see

get_hows()\$words.

dfm optional; an output from a quanteda dfm call, such that users can specify their

own tokenisation scheme (via tokens) as well as other parameters related to the construction of a document-feature matrix (dfm). Make sure the documentfeature matrix is constructed from the texts in the sentocorpus object, other-

wise, results will be spurious or errors may occur.

compute_sentiment 7

Details

For a separate calculation of positive (resp. negative) sentiment, one has to provide distinct positive (resp. negative) lexicons. This can be done using the do.split option in the setup_lexicons function, which splits out the lexicons into a positive and a negative polarity counterpart. NAs are converted to 0, under the assumption that this is equivalent to no sentiment. By default, if the dfm argument is left unspecified, a document-feature matrix (dfm) is created based on a tokenisation that removes punctuation, numbers, symbols and separators, but does not remove stopwords. The number of words for each document is computed based on that some tokenisation. All tokens are converted to lowercase, in line with what the setup_lexicons function does for the lexicons and valence words.

Value

A list containing:

corpus the supplied sentocorpus object; the texts are altered if valence shifters are part

of the lexicons.

sentiment the sentiment scores data.table with a "date" and a "word_count" column

and all lexicon-feature sentiment scores columns.

features a character vector of the different features.

lexicons a character vector of the different lexicons used.

howWithin a character vector to remind how sentiment within documents was aggregated.

Author(s)

Samuel Borms

See Also

dfm, tokens

Examples

```
data("usnews")
data("lexicons")
data("lexicons")

# sentiment computation based on raw frequency counts
corpus <- sento_corpus(corpusdf = usnews)
corpusSample <- quanteda::corpus_sample(corpus, size = 500)

1 <- setup_lexicons(lexicons[c("LM_eng", "HENRY_eng")], valence[["valence_eng"]])
sent <- compute_sentiment(corpusSample, 1, how = "counts")

## Not run:
# same sentiment computation based on a user-supplied dfm with default settings
tok <- quanteda::tokens_tolower(quanteda::tokens(corpus))
dfm <- quanteda::dfm(tok, verbose = FALSE)
sent <- compute_sentiment(corpus, 1, how = "counts", dfm = dfm)
## End(Not run)</pre>
```

8 ctr_agg

ctr_agg

Set up control for aggregation into sentiment measures

Description

Sets up control object for aggregation of document-level textual sentiment into textual sentiment measures (indices).

Usage

```
ctr_agg(howWithin = "proportional", howDocs = "equal_weight",
howTime = "equal_weight", do.ignoreZeros = TRUE, by = "day", lag = 1L,
fill = "zero", alphasExp = seq(0.1, 0.5, by = 0.1), ordersAlm = 1:3,
do.inverseAlm = TRUE, do.normalizeAlm = TRUE, weights = NULL,
dfm = NULL)
```

Arguments

howWithin	a single character vector defining how aggregation within documents will be performed. Should length(howWithin) > 1, the first element is used. For currently available options on how aggregation can occur, see <pre>get_hows()\$words</pre> .
howDocs	a single character vector defining how aggregation across documents per date will be performed. Should length(howDocs) > 1, the first element is used. For currently available options on how aggregation can occur, see <pre>get_hows()\$docs</pre> .
howTime	a character vector defining how aggregation across dates will be performed. More than one choice is possible. For currently available options on how aggregation can occur, see <pre>get_hows()\$time</pre> .
do.ignoreZeros	a logical indicating whether zero sentiment values have to be ignored in the determination of the document weights while aggregating across documents. By default do.ignoreZeros = TRUE, such that documents with an exact score of zero are considered irrelevant.
by	a single character vector, either "day", "week", "month" or "year", to indicate at what level the dates should be aggregated. Dates are displayed as the first day of the period, if applicable (e.g., "2017-03-01" for March 2017).
lag	a single integer vector, being the time lag to be specified for aggregation across time. By default equal to 1L, meaning no aggregation across time.
fill	a single character vector, one of c("zero", "latest", "none"), to control how missing sentiment values across the continuum of dates considered are added. This impacts the aggregation across time, applying the fill_measures function before aggregating, except if fill = "none". By default equal to "zero", which sets the scores (and thus also the weights) of the added dates to zero in the time aggregation.
alphasExp	a numeric vector of all exponential smoothing factors to calculate weights for, used if "exponential" %in% howTime. Values should be between 0 and 1 (both excluded).

ctr_agg 9

ordersAlm a numeric vector of all Almon polynomial orders to calculate weights for, used

if "almon" %in% howTime.

do.inverseAlm a logical indicating if for every Almon polynomial its inverse has to be added,

used if "almon" %in% howTime.

do.normalizeAlm

a logical indicating if every Almon polynomial weights column should sum to

one, used if "almon" %in% howTime.

weights an optional own weighting scheme, always used if provided as a data.frame

with the number of rows equal to the desired lag. The automatic Almon polynomials are created sequentially; if the user wants only specific of such time weighting series it can use almons, select the columns it requires, combine it

into a data. frame and supply it under this argument (see examples).

dfm optional; see compute_sentiment.

Details

For currently available options on how aggregation can occur (via the howWithin, howDocs and howTime arguments), call get_hows.

Value

A list encapsulating the control parameters.

Author(s)

Samuel Borms, Keven Bluteau

See Also

```
fill_measures, almons, compute_sentiment
```

Examples

set up control function with one linear and two chosen Almon weighting schemes

10 ctr_merge

```
a <- almons(n = 70, orders = 1:3, do.inverse = TRUE, do.normalize = TRUE)
ctr3 <- ctr_agg(howTime = c("linear", "own"), by = "year", lag = 70,</pre>
                weights = data.frame(a1 = a[, 1], a2 = a[, 3]))
```

ctr_merge

Set up control for merging sentiment measures

Description

Sets up control object for the optional merging (additional aggregation) of sentiment measures as done by merge_measures.

Usage

```
ctr_merge(sentomeasures, features = NA, lexicons = NA, time = NA,
 do.keep = FALSE)
```

Arguments

sentomeasures

a sentomeasures object created using sento_measures. This is necessary to check whether the other input arguments make sense. features a list with unique features to merge at given name, e.g., list(feat12 = c("feat1", "feat2")). See sentomeasures\$features for the exact names to use. Use NA to apply no merging across this dimension. lexicons a list with unique lexicons to merge at given name, e.g.,

list(lex12 = c("lex1", "lex2")). See sentomeasures\$lexicons for the

exact names to use. Use NA to apply no merging across this dimension.

time a list with unique time weighting schemes to merge at given name, e.g.,

list(tw12 = c("tw1", "tw2")). See sentomeasures\$time for the exact

names to use. Use NA to apply no merging across this dimension.

do.keep a logical indicating if the original sentiment measures should be kept (i.e., the

merged sentiment measures will be added to the current sentiment measures as

additional indices if do.keep = TRUE).

Value

A list encapsulating the control parameters.

                       features = list(journals = c("notInHere", "wapo")))
## End(Not run)
```

ctr_model

Set up control for sentiment measures-based regression modelling

Description

Sets up control object for linear or nonlinear modelling of a response variable onto a large panel of textual sentiment measures (and potentially other variables). See sento-model for details on the estimation and calibration procedure.

Usage

```
ctr_model(model = c("gaussian", "binomial", "multinomial"), type = c("BIC",
   "AIC", "Cp", "cv"), intercept = TRUE, do.iter = FALSE, h = 0,
   alphas = seq(0, 1, by = 0.2), nSample = NULL, trainWindow = NULL,
   testWindow = NULL, oos = 0, start = 1, do.progress = TRUE,
   do.parallel = FALSE)
```

Arguments

model

a character vector with one of the following: "gaussian" (linear regression), "binomial" (binomial logistic regression), or "multinomial" (multinomial logistic regression).

12 ctr_model

type a character vector indicating which model calibration approach to use. Supports "BIC", "AIC" and "Cp" (Mallows's Cp) as sparse regression adapted information criteria (cf., "On the 'degrees of freedom' of the LASSO"; Zou, Hastie, Tibshirani et al., 2007), and "cv" (cross-validation based on the train function from the caret package). The adapted information criteria are currently only available for a linear regression.

intercept a logical, TRUE by default fits an intercept.

do.iter a logical, TRUE induces an iterative estimation of models at the given nSample

size and performs the associated one-step ahead out-of-sample prediction exer-

cise through time.

h an integer value that shifts the time series to have the desired prediction setup;

 $h=\emptyset$ means no change to the input data (nowcasting assuming data is aligned properly), $h>\emptyset$ shifts the dependent variable by h periods (i.e. rows) further in

time (forecasting), h < 0 shifts the independent variables by h periods.

alphas a numeric vector of the different alphas to test for during calibration, between 0

and 1. A value of 0 pertains to Ridge regression, a value of 1 to LASSO regression; values in between are pure elastic net. The lambda values tested for are chosen by the glmnet function or set to $10^seq(2, -2, length.out = 100)$

in case of cross-validation.

nSample a positive integer as the size of the sample for model estimation at every itera-

tion (ignored if iter = FALSE).

trainWindow a positive integer as the size of the training sample in cross-validation (ignored

if type != "cv").

testWindow a positive integer as the size of the test sample in cross-validation (ignored if

type != "cv").

oos a non-negative integer to indicate the number of periods to skip from the end

of the cross-validation training sample (out-of-sample) up to the test sample

(ignored if type != "cv").

start a positive integer to indicate at which point the iteration has to start (ignored if

iter = FALSE). For example, given 100 possible iterations, start = 70 leads

to model estimations only for the last 31 samples.

do.progress a logical, if TRUE progress statements are displayed during model calibration.

do.parallel a logical, if TRUE the %dopar% construct from the **foreach** package is ap-

plied for iterative model estimation. A proper parallel backend needs to be set up to make it work. No progress statements are displayed whatsoever when TRUE. For cross-validation models, parallelization can also be carried out for single-run models, whenever a parallel backend is set up. See the examples in

sento_model.

Value

A list encapsulating the control parameters.

Author(s)

Samuel Borms, Keven Bluteau

diff.sentomeasures 13

See Also

```
sento_model
```

Examples

diff.sentomeasures

Differencing of sentiment measures

Description

Differences the sentiment measures from a sentomeasures object.

Usage

```
## S3 method for class 'sentomeasures'
diff(x, lag = 1, differences = 1, ...)
```

Arguments

```
    a sentomeasures object created using sento_measures.
    a numeric, see documentation for the generic diff.
    a numeric, see documentation for the generic diff.
    not used.
```

Value

A modified sentomeasures object, with the measures replaced by the differenced measures as well as updated statistics.

Author(s)

Samuel Borms

14 epu

Examples

```
data("usnews")
data("lexicons")
data("valence")

# construct a sentomeasures object to start with
corpus <- sento_corpus(corpusdf = usnews)
corpusSample <- quanteda::corpus_sample(corpus, size = 500)
1 <- setup_lexicons(lexicons[c("LM_eng", "HENRY_eng")], valence[["valence_eng"]])
ctr <- ctr_agg(howTime = c("equal_weight", "linear"), by = "year", lag = 3)
sentomeasures <- sento_measures(corpusSample, 1, ctr)

# first-order difference sentiment measures with a lag of two
diffed <- diff(sentomeasures, lag = 2, differences = 1)</pre>
```

epu

Monthly Economic Policy Uncertainty Index

Description

Monthly values of a news-based index of U.S. Economic Policy Uncertainty (EPU) between January 1980 and September 2014, including a binomial and a multinomial example series. For more information on its calculation, see this. Following columns are present:

- date. Date as "yyyy-mm-01".
- index. A numeric monthly index value.
- above. A factor with value "above" if the index is greater than the mean of the entire series, else "below".
- aboveMulti. A factor with values "above+", "above", "below" and "below-" if the index is greater than the 75% quantile and the 50% quantile, or smaller than the 50% quantile and the 25% quantile, respectively and in a mutually exclusive sense.

Usage

```
data("epu")
```

Format

A data. frame with 417 rows and 4 columns.

Source

Research on Economic Policy Uncertainty

exponentials 15

exponentials

Compute exponential weighting curves

Description

Computes exponential weighting curves. Handy to self-select specific time aggregation weighting schemes for input in ctr_agg.

Usage

```
exponentials(n, alphas = seq(0.1, 0.5, by = 0.1))
```

Arguments

n a single numeric to indicate the length of the curve (the number of lags).

alphas a numeric vector of decay factors.

Value

A data. frame of exponential weighting curves per value of alphas.

See Also

ctr_agg

extract_peakdocs

Extract dates and documents related to sentiment peaks

Description

This function gives the dates and documents for which aggregated sentiment is most extreme (lowest, highest or both in absolute terms). The extracted dates are unique, even when, for example, all most extreme sentiment values (for different sentiment measures) occur on only one date.

Usage

```
extract_peakdocs(sentomeasures, sentocorpus, n = 10, type = "both",
do.average = FALSE)
```

16 fill_measures

Arguments

sentomeasures a sentomeasures object created using sento_measures.

the sentocorpus object created with sento_corpus, used for the construction of the input sentomeasures object.

a numeric value to indicate the number of dates associated to sentiment peaks to extract.

type a character value, either "pos", "neg" or "both", respectively to look for the n dates related to the most positive, most negative or most extreme (in absolute terms) sentiment occurrences.

do.average a logical to indicate whether peaks should be selected based on the average sentiment value per date.

Value

A list with as elements "dates", "ids" and "documents", corresponding to the n extracted sentiment peak dates and associated document ids and texts.

Author(s)

Samuel Borms

Examples

```
data("usnews")
data("lexicons")
data("valence")

# construct a sentomeasures object to start with
corpus <- sento_corpus(corpusdf = usnews)
corpusSample <- quanteda::corpus_sample(corpus, size = 500)
1 <- setup_lexicons(lexicons[c("LM_eng", "HENRY_eng")], valence[["valence_eng"]])
ctr <- ctr_agg(howTime = c("equal_weight", "linear"), by = "month", lag = 3)
sentomeasures <- sento_measures(corpusSample, 1, ctr)

# extract the peaks
peaksAbs <- extract_peakdocs(sentomeasures, corpus, n = 5)
peaksPos <- extract_peakdocs(sentomeasures, corpus, n = 5, type = "pos")
peaksNeg <- extract_peakdocs(sentomeasures, corpus, n = 5, type = "neg")</pre>
```

fill_measures

Add and fill missing dates

Description

Adds missing dates between earliest and latest date of a sentomeasures object, such that time series is continuous date-wise. Fills in these dates with either 0, the respective latest non-missing value or NA.

get_hows 17

Usage

```
fill_measures(sentomeasures, fill = "zero")
```

Arguments

sentomeasures a sentomeasures object created using sento_measures.

fill an element of c("zero", "latest", NA); the first and last assume missing

dates represent zero sentiment, the second assumes missing dates represent con-

stant sentiment.

Value

A modified sentomeasures object.

Author(s)

Samuel Borms

Examples

```
data("usnews")
data("lexicons")
data("valence")

# construct a sentomeasures object to start with
corpus <- sento_corpus(corpusdf = usnews)
corpusSample <- quanteda::corpus_sample(corpus, size = 500)
1 <- setup_lexicons(lexicons[c("LM_eng", "HENRY_eng")], valence[["valence_eng"]])
ctr <- ctr_agg(howTime = c("equal_weight", "linear"), by = "year", lag = 3)
sentomeasures <- sento_measures(corpusSample, l, ctr)

# fill measures
f1 <- fill_measures(sentomeasures)
f2 <- fill_measures(sentomeasures, fill = "latest")
f3 <- fill_measures(sentomeasures, fill = NA)</pre>
```

get_hows

Options supported to perform aggregation into sentiment measures

Description

Call for information purposes only. Used within ctr_agg to check if supplied aggregation hows are supported.

Usage

```
get_hows()
```

18 lexicons

Details

See the package's vignette for a thoughtful explanation of the different aggregation options. The howWithin = "proportionalPol" option divides each document's initial sentiment score by the number of polarized words found in the document (counting each word only once would it appear multiple times), instead of the total number of words which the "proportional" option gives.

Value

A list with the supported aggregation hows for arguments howWithin ("words"), howDows ("docs") and howTime ("time"), to be supplied to ctr_agg.

See Also

ctr_agg

lexicons

Built-in lexicons

Description

A list containing all built-in lexicons as a data.table with two columns: a x column with the words, and a y column with the polarities. The list element names incorporate consecutively the name and language, and "_tr" as suffix if the lexicon is translated. The translation was done via Microsoft Translator through Microsoft Word. Only the entries that conform to the original language entry after retranslation, and those that have actually been translated, are kept. The last condition is assumed to be fulfilled when the translation differs from the original entry. All words are in lowercase. The lexicons are in the format required for further sentiment analysis. The built-in lexicons are the following:

- FEEL_eng_tr (French Expanded Emotion Lexicon)
- FEEL_fr
- FEEL_nl_tr
- GI_eng (General Inquirer, i.e. Harvard IV-4 combined with Laswell)
- GI_fr_tr
- GI_nl_tr
- HENRY_eng (Henry)
- HENRY_fr_tr
- HENRY_nl_tr
- LM_eng (Loughran and McDonald)
- LM_fr_tr
- LM_nl_tr

Other immediate lexicon options can be found in the **lexicon** package, more specifically the datasets preceded by hash_sentiment_.

merge_measures 19

Usage

```
data("lexicons")
```

Format

A list with all built-in lexicons, appropriately named as "NAME_language(_tr)".

Source

FEEL lexicon

GI lexicon

HENRY lexicon

LM lexicon

Examples

```
lexicons[c("FEEL_eng_tr", "LM_eng")]
```

merge_measures

Merge sentiment measures

Description

Merge (further aggregate) measures by combining across provided lexicons, features, and time weighting schemes dimensions. The combination occurs by taking the mean of the relevant measures.

Usage

```
merge_measures(ctr)
```

Arguments

ctr

output from a ctr_merge call.

Value

A modified sentomeasures object, with only the sentiment measures required, including updated information and statistics, but the original sentiment scores data.table untouched.

Author(s)

Samuel Borms

See Also

```
ctr_merge
```

20 perform_agg

Examples

perform_agg

Aggregate textual sentiment across documents and time

Description

Condense document-level textual sentiment scores into a panel of textual sentiment measures by aggregating across documents and time. This function is called within sento_measures, applied on the output of compute_sentiment.

Usage

```
perform_agg(toAgg, ctr)
```

Arguments

toAgg output from a compute_sentiment call.

ctr output from a ctr_agg call. The howWithin argument plays no further role from

this point on.

Value

A sentomeasures object.

Author(s)

Samuel Borms, Keven Bluteau

perform_MCS 21

See Also

```
compute_sentiment, ctr_agg, sento_measures
```

Examples

```
data("usnews")
data("lexicons")
data("valence")

# computation of sentiment and aggregation into sentiment measures
corpus <- sento_corpus(corpusdf = usnews)
corpusSample <- quanteda::corpus_sample(corpus, size = 500)
1 <- setup_lexicons(lexicons[c("LM_eng", "HENRY_eng")], valence[["valence_eng"]])

ctr <- ctr_agg(howTime = c("linear"), by = "year", lag = 3)
sentomeasures <- perform_agg(sent, ctr)</pre>
```

perform_MCS

Apply model confidence set (MCS) procedure to a selection of models

Description

Calculates the model confidence set (see "The Model Confidence Set"; Hansen, Lunde and Nason, 2011) as implemented in the MCS package, for a set of different sentomodeliter objects.

Usage

```
perform_MCS(models, loss = c("DA", "errorSq", "AD", "accuracy"), ...)
```

Arguments

models	a named list of sentomodeliter objects. All models should be of the same family, being either "gaussian", "binomial" or "multinomial", and have performance data of the same dimensions.
loss	a single character vector, either "DA" (directional <i>in</i> accuracy), "errorSq" (squared errors), "AD" (absolute errors) or "accuracy" (<i>in</i> accurate class predictions). This argument defines on what basis the model confidence set is calculated. The first three options are available for "gaussian" models, the last option applies only to "binomial" and "multinomial" models.
	other parameters that can be supplied to the MCSprocedure function. If empty, its default values are used.

Value

An object as returned by the MCSprocedure function.

## End(Not run)
```

plot.sentomeasures

Plot sentiment measures

Description

Straightforward plotting method that shows all sentiment measures from the provided sentomeasures object in one plot, or the average along one of the lexicons, features and time weighting dimensions. We suggest to make use of the select_measures function when you desire to plot only a subset of the sentiment measures.

Usage

```
## S3 method for class 'sentomeasures'
plot(x, group = "all", ...)
```

Arguments

x a sentomeasures object created using sento_measures.
group a value from c("lexicons", "features", "time", "all"). The first three choices display the average of all measures from the same group, in a different color. The choice "all" displays every single sentiment measure in a separate color, but this may look visually overwhelming very fast, and can be quite slow.
... not used.

Value

Returns a simple ggplot object, which can be added onto (or to alter its default elements) by using the + operator (see examples). By default, a legend is positioned at the top if there are at maximum twelve line graphs plotted.

Author(s)

Samuel Borms

Examples

```
data("usnews")
data("lexicons")
data("valence")

# construct a sentomeasures object to start with
corpus <- sento_corpus(corpusdf = usnews)
corpusSample <- quanteda::corpus_sample(corpus, size = 500)
1 <- setup_lexicons(lexicons[c("LM_eng")], valence[["valence_eng"]])</pre>
```

24 plot.sentomodeliter

```
ctr <- ctr_agg(howTime = c("equal_weight", "linear"), by = "year", lag = 3)
sentomeasures <- sento_measures(corpusSample, 1, ctr)

# plot sentiment measures
plot(sentomeasures, group = "features")

## Not run:
# adjust appearance of plot
p <- plot(sentomeasures)
p <- p +
    ggthemes::theme_base() +
    scale_x_date(name = "month-year") +
    scale_y_continuous(name = "newName")
p
## End(Not run)</pre>
```

plot.sentomodeliter

Plot iterative predictions versus realized values

Description

Displays a plot of all predictions made through the iterative model computation as incorporated in the input sentomodeliter object, as well as the corresponding true values.

Usage

```
## S3 method for class 'sentomodeliter' plot(x, ...)
```

Arguments

```
x a sentomodeliter object created using sento_model.
... not used.
```

Value

Returns a simple ggplot object, which can be added onto (or to alter its default elements) by using the + operator (see examples).

Author(s)

Samuel Borms

## End(Not run)
```

plot_attributions

Plot prediction attributions at specified level

Description

Shows a plot of the attributions along the dimension provided, stacked per date.

Usage

```
plot_attributions(attributions, group = "features")
```

Arguments

```
attributions an output from a retrieve_attributions call.
group a value from c("lexicons", "features", "time").
```

26 predict.sentomodel

Details

See sento_model for an elaborate modelling example including the calculation and plotting of attributions. This function does not handle the plotting of the attribution of individual documents, since there are often a lot of documents involved and they appear only once at one date (even though a document may contribute to predictions at several dates, depending on the number of lags in the time aggregation).

Value

Returns a simple ggplot object, which can be added onto (or to alter its default elements) by using the + operator (see examples). By default, a legend is positioned at the top if the number of components of the dimension (thus, individual line graphs) is at maximum twelve.

Samuel Borms, Keven Bluteau

predict.sentomodel

Make predictions from a sentomodel object

Description

Prediction method for sentomodel class, with usage along the lines of predict.glmnet, but simplified in terms of allowed parameters.

Usage

```
## S3 method for class 'sentomodel'
predict(object, newx, type, offset = NULL, ...)
```

Arguments

object a sentomodel object created with sento_model. a matrix of numeric values with all explanatory variables to be used for the newx prediction(s), structured row-by-row; see documentation for predict.glmnet. The number of variables should be equal to sentomodel\$nVar, being the sum of the number of original sentiment measures and the number of additional explanatory variables. Variables discarded in the regression process are discarded again here, based on sentomodel\$discarded. type type of prediction required, a value from c("link", "response", "class"), see documentation for predict.glmnet.

not used. Any values here will be ignored.

not used. . . .

offset

Value

A prediction output depending on the type argument.

retrieve_attributions 27

Samuel Borms

See Also

```
predict.glmnet, sento_model
```

retrieve_attributions Retrieve top-down sentiment attributions given model object

Description

Computes the attributions to predictions for a (given) number of dates at all possible sentiment dimensions, based on the coefficients associated to each sentiment measure, as estimated in the provided model object.

Usage

```
retrieve_attributions(model, sentomeasures, do.normalize = FALSE,
  refDates = NULL, factor = NULL)
```

Arguments

model	a sentomodel or sentomodeliter object created with sento_model.
sentomeasures	the sentomeasures object, as created with ${\tt sento_measures}$, used to estimate the model from the first argument.
do.normalize	a logical, TRUE divides each element of every attribution vector at a given date by its L2-norm at that date, normalizing the values between -1 and 1. The document attributions are not normalized.
refDates	the dates at which attribution is to be performed. These should be between the latest date available in the input sentomeasures object and the first estimation sample date, i.e. model\$dates[1] if model is a sentomodel object. All dates should also be present in sentomeasures\$measures\$date. If NULL (default), attribution is calculated for all in-sample dates. Ignored if model is a sentomodeliter object, for which attribution is calculated for all out-of-sample prediction dates.
factor	the factor level as a single character vector for which attribution has to be calculated in case of (a) multinomial model(s). Ignored for linear and binomial

Details

models.

See sento_model for an elaborate modelling example including the calculation and plotting of attributions. The attribution for logistic models is represented in terms of log odds. For binomial models, it is calculated with respect to the last factor level or factor column.

28 scale.sentomeasures

Value

A list with all dimensions for which aggregation is computed, being "documents", "lexicons", "features" and "time". The last three dimensions are data.tables having a "date" column and the other columns the different components of the dimension, with the attributions as values. Document-level attribution is further decomposed into a data.table per date, with "id", "date" and "attrib" columns.

sento_model
```

scale.sentomeasures

Scaling and centering of sentiment measures

Description

Scales and centers the sentiment measures from a sentomeasures object, column-per-column. By default, the measures are normalized. NAs are removed first.

Usage

```
## S3 method for class 'sentomeasures'
scale(x, center = TRUE, scale = TRUE)
```

Arguments

a sentomeasures object created using sento_measures.
 a logical, see documentation for the generic scale.
 a logical, see documentation for the generic scale.

Value

A modified sentomeasures object, with the measures replaced by the scaled measures as well as updated statistics.

Author(s)

Samuel Borms

select_measures 29

Examples

```
data("usnews")
data("lexicons")
data("valence")

# construct a sentomeasures object to start with
corpus <- sento_corpus(corpusdf = usnews)
corpusSample <- quanteda::corpus_sample(corpus, size = 500)
1 <- setup_lexicons(lexicons[c("LM_eng", "HENRY_eng")], valence[["valence_eng"]])
ctr <- ctr_agg(howTime = c("equal_weight", "linear"), by = "year", lag = 3)
sentomeasures <- sento_measures(corpusSample, 1, ctr)

# scale sentiment measures
scaled <- scale(sentomeasures)</pre>
```

select_measures

Select sentiment measures

Description

Selects all sentiment measures which include either all of the given selection components combined, or those who's name consist of at least one of the selection components.

Usage

```
select_measures(sentomeasures, toSelect, do.combine = TRUE)
```

Arguments

sentomeasures a sentomeasures object created using sento_measures.

toSelect a character vector of the lexicon, feature and time weighting scheme names, to

indicate which measures need to be selected. One can also supply a list of such character vectors, in which case do.combine = TRUE is set automatically,

such that the separately specified combinations are selected.

do.combine a logical indicating if only measures for which all (do.combine = TRUE) or

at least one (do.combine = FALSE) of the selection components should occur in each sentiment measure's name in the selection. If do.combine = TRUE, the toSelect argument can only consist of one lexicon, one feature, and one time

weighting scheme at maximum.

Value

A modified sentomeasures object, with only the sentiment measures required, including updated information and statistics, but the original sentiment scores data.table untouched.

30 sento_corpus

Author(s)

Samuel Borms

Examples

```
data("usnews")
data("lexicons")
data("valence")

# construct a sentomeasures object to start with
corpus <- sento_corpus(corpusdf = usnews)
corpusSample <- quanteda::corpus_sample(corpus, size = 500)
1 <- setup_lexicons(lexicons[c("LM_eng", "HENRY_eng")], valence[["valence_eng"]])
ctr <- ctr_agg(howTime = c("equal_weight", "linear"), by = "year", lag = 3)
sentomeasures <- sento_measures(corpusSample, l, ctr)

# different selections
sel1 <- select_measures(sentomeasures, c("equal_weight"))
sel2 <- select_measures(sentomeasures, c("equal_weight", "linear"), do.combine = FALSE)
sel3 <- select_measures(sentomeasures, c("linear", "LM_eng"))
sel4 <- select_measures(sentomeasures, list(c("linear", "wsj"), c("linear", "economy"))))</pre>
```

sento_corpus

Create a sentocorpus object

Description

Formalizes a collection of texts into a well-defined corpus object, by mainly calling the corpus function from the **quanteda** package. This package provides a fast text mining infrastructure; for more info, see quanteda. Their formal corpus structure is required for better memory management, corpus manipulation, and sentiment calculation. This function mainly performs a set of checks on the input data and prepares the corpus for further sentiment analysis.

Usage

```
sento_corpus(corpusdf, do.clean = FALSE)
```

Arguments

corpusdf

a data.frame (or a data.table, or a tbl) with as named columns: a document "id" column, a "date" column, a "text" column (i.e. the columns where all texts to analyze reside), and a series of feature columns of type numeric, with values pointing to the applicability of a particular feature to a particular text. The latter columns are often binary (1 means the feature is applicable to the document in the same row) or as a percentage to specify the degree of connectedness of a feature to a document. Features could be topics (e.g., legal, political, or economic), but also article sources (e.g., online or printed press),

sento_corpus 31

amongst many more options. If you have no knowledge about features or no particular features are of interest to your analysis, provide no feature columns. In that case, the corpus constructor automatically adds an additional feature column named "dummy". Provide the date column as "yyyy-mm-dd". The id column should be in character mode. All spaces in the names of the features are replaced by underscores.

do.clean

a logical, if TRUE all texts undergo a cleaning routine to eliminate common textual garbage. This includes a brute force replacement of HTML tags and non-alphanumeric characters by an empty string.

Details

A sentocorpus object can be regarded as a specialized instance of a **quanteda** corpus. In theory, all **quanteda** functions applicable to its corpus object can also be applied to a sentocorpus object. However, changing a given sentocorpus object too drastically using some of **quanteda**'s functions might alter the very structure the corpus is meant to have (as defined in the corpusdf argument) to be able to be used as an input in other functions of the **sentometrics** package. There are functions, including corpus_sample or corpus_subset, that do not change the actual corpus structure and may come in handy. To add additional features, use add_features.

Value

A sentocorpus object, derived from a **quanteda** corpus classed list with the elements "documents", "metadata", and "settings" kept. The first element incorporates the corpus represented as a data.frame.

Author(s)

Samuel Borms

# corpus construction
corpus <- sento_corpus(corpusdf = usnews)
# take a random subset making use of quanteda
corpusSmall <- quanteda::corpus_sample(corpus, size = 500)
# deleting a feature
quanteda::docvars(corpus, field = "wapo") <- NULL
# corpus creation when no features are present
corpusDummy <- sento_corpus(corpusdf = usnews[, 1:3])</pre>
```

32 sento_measures

sento_measures	One-way road towards a sentomeasures object
----------------	---

Description

Wrapper function which assembles calls to compute_sentiment and perform_agg, and includes the input sentocorpus and computed sentiment scores in its output. Serves as the most direct way towards a panel of textual sentiment measures as a sentomeasures object.

Usage

```
sento_measures(sentocorpus, lexicons, ctr)
```

Arguments

sentocorpus a sentocorpus object created with sento_corpus.

lexicons output from a setup_lexicons call.

ctr output from a ctr_agg call.

Value

A sentomeasures object, which is a list containing:

measures a data.table with a "date" column and all textual sentiment measures as re-

maining columns.

features a character vector of the different features.

lexicons a character vector of the different lexicons used.

time a character vector of the different time weighting schemes used.

by a single character vector specifying the time interval of aggregation used.

stats a data.frame with a series of elementary statistics (mean, standard deviation,

maximum, minimum, and average correlation with all other measures) for each

individual sentiment measure.

sentiment the sentiment scores data.table with "date", "word_count" and lexicon-

feature sentiment scores columns. If ctr\$do.ignoreZeros = TRUE, all zeros

are replaced by NA.

howWithin a single character vector to remind how sentiment within documents was ag-

gregated.

howDocs a single character vector to remind how sentiment across documents was ag-

gregated.

fill a single character vector that specifies if and how missing dates have been

added before aggregation across time was carried out.

do.ignoreZeros a single character vector to remind if documents with zero sentiment have

been ignored in the within-document aggregation.

attribWeights a list of document and time weights used in the retrieve_attributions

function. Serves further no direct purpose.

sentomeasures <- sento_measures(corpusSample, 1, ctr)</pre>
summary(sentomeasures)
```

sento_model

Optimized and automated sparse regression

Description

Linear or nonlinear penalized regression of any dependent variable on the wide number of sentiment measures and potentially other explanatory variables. Either performs a regression given the provided variables at once, or computes regressions sequentially for a given sample size over a longer time horizon, with associated one-step ahead prediction performance metrics.

Usage

```
sento\_model(sentomeasures, y, x = NULL, ctr)
```

Arguments

sentomeasures

a sentomeasures object created using sento_measures. There should be at least two explanatory variables including the ones provided through the x argument.

y a one-column data.frame or a numeric vector capturing the dependent (response) variable. In case of a logistic regression, the response variable is either a factor or a matrix with the factors represented by the columns as binary indicators, with the second factor level or column as the reference class in case of a binomial regression. No NA values are allowed.

a named data.frame with other explanatory variables as numeric, by default

set to NULL.

ctr output from a ctr_model call.

Details

Х

Models are computed using the elastic net regularization as implemented in the **glmnet** package, to account for the multidimensionality of the sentiment measures. Additional explanatory variables are not subject to shrinkage. Independent variables are normalized in the regression process, but coefficients are returned in their original space. For a helpful introduction to **glmnet**, we refer to their vignette. The optimal elastic net parameters lambda and alpha are calibrated either through a to specify information criterion or through cross-validation (based on the "rolling forecasting origin" principle, using the train function). In the latter case, the training metric is automatically set to "RMSE" for a linear model and to "Accuracy" for a logistic model. We suppress many of the details that can be supplied to the glmnet and train functions we rely on, for the sake of user-friendliness.

Value

If ctr\$do.iter = FALSE, a sentomodel object which is a list containing:

reg optimized regression, i.e. a model-specific glmnet object.

model the input argument ctr\$model, to indicate the type of model estimated.

x a matrix of the values used in the regression for all explanatory variables.

alpha calibrated alpha.
lambda calibrated lambda.

trained output from train call (if ctr\$type = "cv").

ic a list composed of two elements: the information criterion used in the cali-

bration under "criterion", and a vector of all minimum information criterion

values for each value in alphas under "opts" (if ctr\$type != "cv").

dates sample reference dates as a two-element character vector, being the earliest

and most recent date from the sentomeasures object accounted for in the esti-

mation window.

nVar the sum of the number of sentiment measures and other explanatory variables

inputted.

discarded a named logical vector of length equal to the number of sentiment measures,

in which TRUE indicates that the particular sentiment measure has not been considered in the regression process. A sentiment measure is not considered when it is a duplicate of another, or when at least 25% of the observations are equal to

zero.

If ctr\$do.iter = TRUE, a sentomodeliter object which is a list containing:

models all sparse regressions, i.e. separate sentomodel objects as above, as a list with

as names the dates from the perspective of the sentiment measures at which predictions for performance measurement are carried out (i.e. one date step

beyond the date sentomodel\$dates[2]).

alphas calibrated alphas.

lambdas calibrated lambdas.

performance a data.frame with performance-related measures, being "RMSFE" (root mean

squared forecasting error), "MAD" (mean absolute deviation), "MDA" (mean directional accuracy, in which's calculation zero is considered as a positive; in percentage points), "accuracy" (proportion of correctly predicted classes in case of a logistic regression; in percentage points), and each's respective individual values in the sample. Directional accuracy is measured by comparing the change in the realized response with the change in the prediction between two consecutive time points (omitting the very first prediction, resulting in NA). Only the relevant performance statistics are given depending on the type of regression. Dates are as in the "models" output element, i.e. from the perspective of the sentiment

measures.

setup_lexicons 37

setup_lexicons

Set up lexicons (and valence word list) for use in sentiment analysis

Description

Structures provided lexicons and potentially integrates valence words. One can also provide (part of) the built-in lexicons from data("lexicons") or a valence word list from data("valence") as an argument. Part of this function mimicks the as_key function from the **sentimentr** package to make the output coherent, convert all words to lowercase and check for duplicates.

Usage

```
setup_lexicons(lexiconsIn, valenceIn = NULL, do.split = FALSE)
```

Arguments

lexiconsIn

a named list of (raw) lexicons, each element as a data.frame or a data.table with respectively a words column and a polarity score column. Alternatively, a subset of the already formatted built-in lexicons accessible via lexicons can be declared too, as part of the same list input. If only (some of) the package built-in lexicons want to be used (with *no* valence shifters), one can simply supply lexicons[c(...)] as an argument to either sento_measures or compute_sentiment. However, it is strongly recommended to pass all lexicons (and a valence word list) to this function first, in any case.

valenceIn

a single valence word list as a data. frame or a data. table with respectively a words column, a type column (1 for negators, 2 for amplifiers/intensifiers, and 3 for deamplifiers/downtoners) and a score column. Suggested scores are -1, 2, and 0.5 respectively, and should be the same within each type. This argument can also be one of the already formatted built-in valence word lists accessible via valence. If NULL, no valence word list is part of this function's output, nor will it applied in the sentiment analysis.

do.split

a logical that if TRUE splits every lexicon into a separate positive polarity and negative polarity lexicon.

Value

A list with each lexicon as a separate element according to its name, as a data.table, and optionally an element named valence that comprises the valence words. Every x column contains the words, every y column contains the polarity score, and for the valence word list, t contains the word type. If a valence word list is provided, all lexicons are expanded by copying the respective lexicon, and changing the words and scores according to the valence word type: "NOT_" is added for negators, "VERY_" is added for amplifiers and "HARDLY_" is added for deamplifiers. Lexicon scores are multiplied by -1, 2 and 0.5 by default, respectively, or the first value of the scores column of the valence word list.

38 subset_measures

Examples

```
data("lexicons")
data("valence")
# sets up output list straight from built-in word lists including valence words
11 <- c(lexicons[c("LM_eng", "HENRY_eng")], valence[["eng"]])</pre>
# including a self-made lexicon, with and without valence shifters
lexIn <- c(list(myLexicon = data.table(w = c("nice", "boring"), s = c(2, -1))),</pre>
           lexicons[c("GI_eng")])
valIn <- valence[["valence_eng"]]</pre>
12 <- setup_lexicons(lexIn)</pre>
13 <- setup_lexicons(lexIn, valIn)</pre>
14 <- setup_lexicons(lexIn, valIn, do.split = TRUE)</pre>
## Not run:
# include lexicons from lexicon package
library("lexicon")
lexIn2 <- list(hul = lexicon::hash_sentiment_huliu, joc = lexicon::hash_sentiment_jockers)</pre>
15 <- setup_lexicons(c(lexIn, lexIn2), valIn)</pre>
## End(Not run)
```

subset_measures

Subset sentiment measures

Description

Subsets rows of the sentiment measures based on its columns.

Usage

```
subset_measures(sentomeasures, subset)
```

Arguments

```
sentomeasures a sentomeasures object created using sento_measures. subset a logical expression indicating the rows to keep.
```

Value

A modified sentomeasures object, with only the kept rows, including updated information and statistics, but the original sentiment scores data.table untouched.

Samuel Borms

to_global 39

Examples

to_global

Merge sentiment measures into multiple weighted global sentiment indices

Description

Merges all sentiment measures into a weighted global textual sentiment measure for each of the lexicons, features, and time dimensions.

Usage

```
to_global(sentomeasures, lexicons = 1, features = 1, time = 1)
```

Arguments

sentomeasures a sentomeasures object created using sento_measures.

lexicons a numeric vector of weights, of size length(sentomeasures\$lexicons), in

the same order. By default set to 1, which means equally weighted.

features a numeric vector of weights, of size length(sentomeasures\$features), in

the same order. By default set to 1, which means equally weighted.

time a numeric vector of weights, of size length(sentomeasures\$time), in the

same order. By default set to 1, which means equally weighted.

Details

This function returns no new sentomeasures object. The global sentiment measures as outputted can still easily be added to regressions as an additional variable using the x argument in the sento_model function. The measures are constructed from weights that indicate the importance (and sign) along each component from the lexicons, features, and time dimensions. There is

40 usnews

no condition in terms of allowed weights. For example, the global index based on the supplied lexicon weights ("globLex") is obtained first by multiplying every sentiment measure with its corresponding weight (meaning, the weight given to the lexicon the sentiment is computed with), then by taking the average per date.

Value

A data.frame with the different types of weighted global sentiment measures, named "globLex", "globFeat", "globTime" and "global", with dates as row names. The last measure is an average of the three other measures.

Texts (not) relevant to the U.S. economy

Description

A collection of texts annotated by humans in terms of relevance to the U.S. economy or not. The texts come from two major journals in the U.S. (The Wall Street Journal and The Washington Post) and cover 4145 documents between 1995 and 2014. It contains following information:

- id. A character ID identifier.
- date. Date as "yyyy-mm-dd".

valence 41

- text. Texts in character format.
- wsj. Equals 1 if the article comes from The Wall Street Journal.
- wapo. Equals 1 if the article comes from The Washington Post.
- economy. Equals 1 if the article is relevant to the U.S. economy.
- noneconomy. Equals 1 if the article is not relevant to the U.S. economy.

Usage

```
data("usnews")
```

Format

A data. frame, formatted as required to be an input for sento_corpus.

Source

Economic News Article Tone and Relevance

Examples

```
data("usnews")
usnews[3192, "text"]
usnews[1:5, c("id", "date", "text")]
```

valence

Built-in valence word lists

Description

A list containing all built-in valence word lists, a data.table with three columns: a x column with the words, a t column with the type of valence words, and a y column with the values associated to each word and type of valence shifter. The list element names incorporate the language of the valence word list. All non-English word lists are translated via Microsoft Translator through Microsoft Word. Only the entries whose translation differs from the original entry are kept. The valence word lists are in the form required for further sentiment analysis. All words are in lowercase. The built-in valence word lists are the following:

- valence_eng
- valence_fr
- · valence nl

Usage

```
data("valence")
```

valence valence

Format

A list with all built-in valence word lists, appropriately named.
